

## AEP Netilla Security Platform<sup>®</sup> Vasco Digipass Integration

End-to-end Security for Remote and Mobile Workers

AEP's Netilla Security Platform (NSP) helps companies satisfy one of their most pressing needs: Making business applications remotely available to employees and partners, anywhere, anytime. Incorporating VASCO's Digipass 2-Factor authentication directly within the NSP platform plugs the security gap caused by static passwords for user authentication.

### Key Features

VASCO's Digipass enables users to generate One-Time Passwords that safeguard access to e-business and e-banking applications, allowing for more secure transactions. The Digipass Plug-In is now natively integrated into the NSP product line, allowing simplified user management from one database without the need for an additional server.

- Integrates natively into AEP Networks' NSP product line
- Fully compatible with Active Directory user management
- User credential management from one user database
- Ability to add Virtual Digipass (SMS Backup service) as option
- Digipass configuration and management accessible from within the NSP's administrative web interface

### Compliance Features

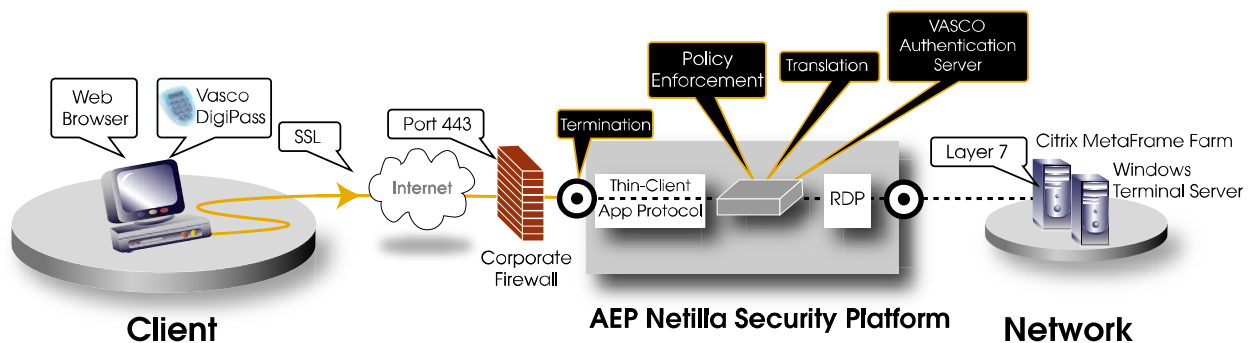

- Provides End-to-End Security solution for ensuring data privacy
- Supports HIPAA, Sarbanes-Oxley and FDIC mandates for 2-Factor authentication

### Key Benefits

Digipass patented technology eliminates the weakest link in any security infrastructure: The use of static passwords that are easily stolen, guessed, reused, or shared. Digipass can be deployed as a small hand-held device, as a smart card reader, as software for computers, laptops, PDA's or cell phones.

By integrating the solution directly with the NSP, a wide range of benefits accrue:

- Integration of VASCO software into the NSP negates the need for a separate additional authentication server
- Adds Strong Authentication to complex / mixed network environments
- Remote workers gain access to information and applications while meeting the most stringent security standards
- Total solution at a competitive TCO
